

WEB DEV PROJECT IDEAS THAT WILL ACTUALLY GET YOU AN INTERNSHIP OPPURTUNITY:

Top 10 Elite Web Dev Projects Nobody Else Is Building (Build any 2 of these bro)

1. Browser-Based Code Execution Sandbox

A LeetCode-like IDE that runs code *entirely in the browser* using WebAssembly — no backend needed. Supports Python, C++, Rust. Shows you understand how modern browser runtimes work.

Stack: React, Pyodide (Python in WASM), Monaco Editor, Web Workers, Tailwind CSS

2. Distributed URL Shortener with Analytics

Not just a shortener — built with consistent hashing, geo-routing, and a real-time click heatmap by country. Think "how Bitly actually works."

Stack: Next.js, Redis (caching + rate limiting), ClickHouse (analytics), Cloudflare Workers, PostgreSQL

3. Real-Time AI Meeting Transcriber + Action Item Extractor

Joins a meeting via mic, transcribes live using Whisper, then auto-generates summaries and follow-up tasks. Push them to Notion/Linear via API.

Stack: Next.js, OpenAI Whisper (streaming), Web Audio API, Notion API / Linear API, Vercel AI SDK

4. Visual Dependency Graph Explorer for NPM Packages

Enter any npm package → see an interactive, zoomable graph of its full dependency tree with bundle size, vulnerability flags, and version conflicts.

Stack: React, D3-force / Cytoscape.js, npm Registry API, OSS Index API (vulns), Vite

5. Local-First Semantic Search Engine for Your Files

Drop in PDFs, notes, docs — the app chunks them, generates embeddings locally, and lets you search by *meaning*, not keywords. Everything runs on-device.

Stack: React + Electron or Tauri, Transformers.js (local embeddings), LanceDB (local vector DB), Node.js

WEB DEV PROJECT IDEAS THAT WILL ACTUALLY GET YOU AN INTE...

Transfer files directly between browsers — no server storage, no size limits, fully encrypted, like AirDrop for the browser. Shows deep networking knowledge.

Stack: Vanilla JS / React, WebRTC Data Channels, simple-peer, Node.js (signaling server only), WebCrypto API

7. Low-Code UI Builder with JSON Schema Export

Drag components onto a canvas, configure props via sidebar, then export a clean JSON schema or live React component code. Like a mini Framer.

Stack: React, dnd-kit, Zustand, Monaco Editor (code preview), AST manipulation with Babel

8. Stock Screener with Custom Formula Builder

Write Excel-like formulas ($PE < 20$ AND $ROE > 15$) to filter thousands of stocks. Backtest the formula on historical data and see a performance chart.

Stack: Next.js, Web Workers (formula parsing), Financial Modeling Prep API, Recharts, PostgreSQL

9. End-to-End Encrypted Notes App (Zero-Knowledge)

Notes are encrypted *in the browser* before hitting the server. Even the DB admin can't read them. Implements a real zero-knowledge architecture.

Stack: React, WebCrypto API (AES-GCM + PBKDF2), Supabase (stores only ciphertext), Node.js

10. Multiplayer Pixel Canvas (r/place Clone)

A real-time shared canvas where users place pixels, with cooldowns, undo history, territory analytics, and a replay mode showing the canvas evolve over time.

Stack: React, Canvas API, Redis (pixel state + pub/sub), Socket.io, PostgreSQL (event log), FFmpeg (replay export)

All the best bro>
